

# **[COMPUTER WITH A DETACHABLE LIQUID CRYSTAL DISPLAY]**

## **Abstract of Disclosure**

A desktop computer has a pedestal, a front housing, a motherboard, a display, and a rear cover. The pedestal is used to support the desktop computer on a desk. The bottom of the front housing is pivotally mounted on the pedestal and tilt-able in a forward-backward direction. The front housing has a front panel facing a user, a top panel horizontally fixed on a top edge of the front panel, and a bottom panel horizontally fixed on a bottom edge of the front panel. The display is fixed vertically on a front side of the front panel. The desktop computer combines the display with the computer housing so as to decrease the volume and simplify the structure. Furthermore, since the display is detachable fixed on the computer housing, the maintenance and the replacement of the display are easier and feasible.
